Dear Editors,

Please consider the manuscript “How much can a Scrabble move score? Exact records from one tile to seven” for publication in *The American Mathematical Monthly*.

High-scoring Scrabble constructions have circulated for many years. While looking into these records, I realized that I could find no previous proof that the proposed maxima were optimal. This manuscript gives computer-assisted proofs for moves using one through seven tiles under the NWL23 and CSW24 dictionaries, together with reproducible certificates and legal constructions.

I hope that the problem and its elementary combinatorial ideas will be of interest to Monthly readers. The manuscript includes a disclosure of the use of OpenAI Codex (GPT-5) for computer-code verification and text editing. Thank you for considering the manuscript.

Sincerely,

Mathias Valla
